We work hard to recognize that it's not just the company we provide the relocation services for that makes us so, but that it is our people. You can watch our people working at their desks, or chugging along in a motor coach, or giving presentations in Brussels. We work hard to give each and every one of our people a chance to make your company smile. We remain committed to the small and big moves alike. For those moving from our central U.S. location, we've expanded our offerings and have recently formed a partnership with ThruHaul, a U.S. based trucking company which makes our relocation activities even simpler and more convenient for you. Based on personal experience and our continuous training, Our Relocation Services has set a new standard in the move management field by defining a new standard of integrity, service, respect for our valued clients, and fair value. We are committed to maintaining a world class reputation, and our satisfaction level is top priority.Q: How to create a list of the rank of elements in each row of a data frame? I have a dataframe, containing 1 row and 4 columns. Each column has a number from 1 to 4 and I need to create a dataframe with 2 rows and

1/4

4 columns, each corresponding to the rank of the number in each of the 4 columns. Example: X Y Z W 1 4 2 3 So, the result should be like this: X Y Z W Rank 1 4 2 3 1 1 4 2 3 2 1 4 2 3 3 1 4 2 3 4 My original dataframe can contain up to 20K rows. I can simply use apply or rank but they seem to be very slow for my case, so I don't want to use this

In September 2013, as an NSA whistleblower Edward Snowden became aware, the BND had gathered emails of more than 100 German phone numbers from the server of one of its foreign partners. It was the partner's job to scrutinize phone calls for a range of countries, including those of the United States, from the BND's collection of communications data. The BND had no legal basis to make use of these data, nor to conduct its own surveillance of the whole country. But that data, Snowden discovered, had in fact been taken and stored. Despite this, the NSA was allowed to have access to the data the BND had gathered, because all the communications were routed through an American company anyway – allowing the NSA to tap the same server. The Snowden revelations are a reminder of how complex and manylayered the intelligence networks are that the US intelligence community deploys around the world. More than 80 agencies comprise the US intelligence community. It is not only the German BND that cooperates with the NSA. Since the US is the global superpower, most countries rely on American technology. Even a partner for business purposes must engage in surveillance, which includes helping the NSA to trace all phone calls and emails sent and received by the partner. As you are reading this, other countries of the European Union are also not only aware of it, but also play a role as whistleblowers have made known. And the EU has found that, while the States can act in secret and support covert programs, not all, or even most, programs are being run in secret. To see how complex the matter of surveillance has become, try to imagine a couple of scenarios: You are an American citizen living in the United States. In the course of your daily routine, you buy a new phone with a SIM card from a service provider, which also has a data connection via a company that provides leased lines. Even if your phone is f30f4ceada
