Due to the popularity of working on a personal computer and the advantage of many applications, such as Primavera P6, Dynamics or the many simulation applications - the field of visualization is now increasingly important for all of us who want to get a first scientific or technical insight into the results of mathematical, physical or technical calculation. This is done with the help of models. The models serve as a tool and hence it is essential that all parameters of a model are correctly calculated and provided in the simulation program in a way that they can be directly shown as a graphic object. Currently, there are no good simulation applications that allow the direct visualization of models and parameter settings in 3D. MST Workshop allows you to take your models and the settings for running your calculations directly into a graphical environment. You can design all your models in three dimensions and can use an endless variety of plug-ins for creating and inserting models, figures and other objects from the drawing program. By setting the parameters in the simulation software you can transfer the model to MST Workshop in an interactive way. This makes it also possible for the user to control the simulation program and check results and the calculated values at any stage. MST Workshop is also an ideal tool to create explanatory graphics, such as product animations. MST Workshop is the ideal application for short or long term projects. It is also a powerful tool for companies that would like to explain their products, to train their sales staff, or to model their products.
